

Knowing What the Traveler **Wants** — before they ask.

A smart engine that learns what each traveler wants — and turns searches into bookings.

MEET MAYA

She is ready to book. We just can't see her.

Mon

Maya searches Delhi -> Barcelona.
Looks at 6 flights.

She leaves to check prices elsewhere.

Wed

She comes back. Searches
Barcelona again. Saves a hotel.

Her interest is clearly growing.

Today

She opens a rival app first — they
remembered her.

We showed her the same page as
everyone.

The signs were there the whole time. Maya isn't a lost cause — she's a missed **chance**.

THE PROBLEM

Ready-to-book travelers leave — and we never learn why

People who clearly want to book end up leaving. Right now we have no way to spot them, win them back, or learn from them.

We can't see early visitors

We don't track people before they log in. So we miss most of what they do on the site.

Right message, wrong time

Our reminders can arrive up to 2 hours late — long after the person has moved on.

We risk losing trust

"Prices dropped 7%" alerts are made up, not real. That can break trust and even cause legal trouble.

We don't measure results

We can't tell if a reminder led to a booking. Without numbers, we can't prove anything works.

WHY IT MATTERS

Every visitor we ignore is money walking out the door

~98%

of people who search never book on a normal travel site. That's our 2% starting point.

+8–18%

more bookings reported when travel sites win back returning visitors.

Rs.1.7–2.8L

extra money each month at our middle estimate (2,000 searches a month).

The system already exists in our code. What's missing is the work to fix the data, measure the results, and act at the right moment. That's exactly what this product does.

These numbers are industry averages (McKinsey 2023, Salesforce 2024), not our own data yet. We will replace them with our own.

OUR SOLUTION

A simple engine that listens, learns, and acts

Every action becomes a clue. Clues add up to an interest score. The score tells us the right thing to do — at the right time.

HOW IT WORKS

From a click to a booking — how it flows

Fast when it matters

Reminders show up while the person is still on the site — not 2 hours later.

Honest by design

Fake price alerts stay OFF until we have real price data. No made-up urgency.

Built to be measured

We hold back 20% of users as a test group, so we can prove it really works.

Built with: React · Express · MongoDB — plus Amadeus, SendGrid, Stripe and Razorpay.

Four features that do the work behind the scenes

Continue Planning card

When she returns, the home page shows the exact search she left — no typing again.

Timely reminder

"Still planning Barcelona?" reaches interested users right away — and never spams them.

Smart recommendations

The home page shows where she wants to go now — not a trip from months ago.

Bring them back by email

When her interest grows enough, a friendly email brings her back — even after she leaves.

The numbers work once we have real traffic

Case	Searches / month	More bookings	Extra money / month	Pays back in
Low	500	+8%	Rs. 35k – 70k	3–8 months
Middle	2,000	+12%	Rs. 1.75L – 2.8L	1–2 months
High	5,000	+18%	Rs. 4.2L – 7.0L	< 1 month

In short: Phase 1 fixes cost only ~3 days and remove legal risk — they pay for themselves many times over. The money case gets strong above ~1,000 searches a month, paying back in 1–2 months in the middle case.

Based on Rs.35k average booking, a 2% starting rate, over 12 months. These are estimates, not promises — we will check them in Phase 2.

HOW WE GET THERE

A simple step-by-step plan — value before scale

After each step we decide: go or stop. We only spend more once we have proven it works.

We're offering a smart way of working, not just a feature

It's already built

The engine is in our code today. We just need to fix it, measure it, and switch it on — not start over.

Honest numbers

Every estimate is marked as an estimate. We promise to replace guesses with our own real data.

Safety first

Phase 1 removes the legal risk from fake prices before anything reaches real users.

Easy to measure

A built-in test group lets us prove it works — or stop early — instead of guessing.

THE TEAM

Four people. One shared goal.

Your Name

Product & Research Lead

Owns the problem and the
business case

Your Name

Backend / Data Engineer

Scoring, background jobs &
connections

Your Name

Frontend Engineer

Home page, recommendations &
tracking

Your Name

Testing & Quality Lead

Testing, measurement & quality

Tip: replace the initials and "Your Name" with each teammate's real name and photo before presenting.

THE ASK

Say yes to **Phase 1 + 2** — fix, then measure.

~9–12 days

of work to remove risk and set up proper measurement.

1 decision

30 days of real data, then a clear go / stop choice on Phase 3.

0 downside

Phase 1 only removes risk — it pays for itself no matter what.

Our vision: a DataArt Travel that spots what a traveler wants the moment it shows — so the next Maya books with **us**, not someone else. Say yes to Phase 1+2, and we'll bring you the proof.

Thank you.

Questions and doubts are very welcome.
